Semiconductor Pin Assignments

The following describes the semiconductor types used in this unit.
For semiconductors marked with page numbers in the index, refer to the corresponding pages in this section. However, in some cases incompatible types are also listed, therefore, when a part is to be replaced, also refer to the Spare Parts section.
In addition, for semiconductors with ID Nos., refer to the separate CD-ROM titled "Semiconductor Pin Assignments" (Sony Part No. 9-968-546-xx) that allows searching for parts by semiconductor type or ID No.
The semiconductors in the manual or on the CD-ROM are listed by equivalent types. Thus the external view or the index mark indication may differ from the actual type.
Pin assignments and block diagrams are based on the IC manufacturer's data book.

本機に使用されている半導体型名の一覧を下記に示します。
索引中，ページが記載されている半導体は，本章の該当ページを参照してください。ただし，互換性のない型名を併記している場合がありますので，部品を交換するときは，Spare Partsの章を参照してください。
また，ID番号が記載されている半導体は，別途発行の "Semiconductor Pin Assignments" CD-ROM版 (ソニー部品番号：9-968-546-xx)を参照してください。
半導体型名またはID番号から検索ができます。
マニュアルまたはCD-ROMに掲載されている半導体は，それぞれの機能を等価的に表わしたものです。
外観やインデックスマークの表示方法が実物と異なる場合があります。
ピン配置およびブロック図はICメーカーのデータブックに従いました。

HDW Video Signal Input Processing (DIF-134, HIF-1, HPR-1, RX-80, SDI-63)

Regarding the HDW series, the two video signals are input as shown in the table.
In addition, video signals are generated by the built-in video test signal generator. The input filter IC115 on the HPR-1 board generates video test signals for recording, and the output filter IC802 generates those for playback.

SDTI (HDCAM) Input (DIF-134, HPR-1) ... When HKDW-102 is installed

The input SDTI (HDCAM) signal is converted to parallel data on the DIF-134 board*. Compressed HDCAM data is extracted from the parallel data by the SDTI decoder IC300. The compressed HDCAM data is phase-adjusted by the FPGA IC400, and is then sent to the HPR-1 board where an error correction code is added to the data for recording.

The CH1/2, 3/4 digital audio data are extracted from the input SDTI (HDCAM) signal by the SDTI IC300 on the DIF-134 board. The extracted audio data are sent to the APR-52 board via the HPR-1 board. The deformatter*1 on the RX-80 board*2 extracts the CH1/2, 3/4 digital audio data from the input HD-SDI signal, and then synchronizes the data with the reference audio clock. The 10-bit Y and 10-bit C parallel video data that are extracted from the input HD-SDI signal and are sent to the HPR-1 board are down-sampled by the input filter IC115, and are then converted from 4:2:2 data to 3:1:1 data. The converted data is further converted to compressed HDCAM data by the BRR encoders *1 IC200 and IC204.

The output data of the input filter is also transferred to the digital signal processing block for playback on the HPR-1 board for bypass EE.

RF Playback Processing (EQ-84)

RF signals played back by respective playback heads are amplified by the playback amplifier in the upper drum, and only output signals from the head selected by the head control signal are sent to the EQ-84 board through the rotary transformer.

The heads for ADV A/B and C/D, BETACAM PB-A (Y/C), and for PB-B (Y/C) are DT heads*. The bimorph drive signal drives the DT heads from the DT-47 board through the slip rings. Video Signal Playback (DM-123) ... **HDW-M/S, DVW-M, MSW-A/M**

The analog Betacam playback Y and C RF signals adjusted by the equalizer on the EQ-84 board are sent to the DM-123 board to receive cosine EQ, FM demodulation, 10-bit A/D conversion, and TBC processing sequentially. The TBC processing performs the following.

- Expand the time base of the playback signals whose time base was compressed by the large-diameter drum*1.
- Expand the time base of the R-Y and B-Y signals recorded by CTDM*2.
- Suppress jitter and skew components contained in the playback signals.

The Y data and R-Y/B-Y data are then multiplexed to 10-bit parallel data, and the multiplexed data is sent to VIOLA on the VPR board*4 through the setup rejection circuit.

SDTI (HDCAM) Output (DIF-134, HPR-1) ... HDW

The compressed HDCAM video data from the SDTI (HDCAM) PB/EE selector IC203, IC207, IC508, and IC509 on the HPR-1 board is sent to the DIF-134 board together with the audio data sent from the APR-52 board.

The video/audio data are converted to SDTI-format parallel data, and the parallel data is converted to serial data. The serial data is output from the connectors SDTI (HDCAM) OUT 1 and SDTI (HDCAM) OUT 2.

HD-SDI Output (HIF-1, SDI-63, VPR-64)

The HD-SDI video output signal processing varies with the format of playback data as shown below.

- HDCAM format playback **... HDW**
  The non-compressed 10-bit HD Y data and 10-bit HD C data decoded on the HPR-1 board are sent to the HIF-1 board for output processing.
- Digital Betacam, MPEG IMX or Betacam SX format playback **... HDW-D/M/S, DVW, MSW**
  The non-compressed 10-bit SD video data decoded on the DPR board is sent to "VIOLA" *1 on the VPR board. The non-compressed 10-bit SD Y data and 10-bit SD C data are sent from VIOLA to the HIF-1 board. These SD video data are up-converted *2 to HD Y data and HD C data by the VSP *3 IC300 on the HIF-1 board.
- Analog Betacam format playback **... HDW-M/S, DVW-M, MSW-A/M**
  The 10-bit SD video data is sent from the TBC block on the DM-123 board to VIOLA on the VPR board. The data is then up-converted to HD Y data and HD C data in the same route as Digital Betacam format playback.

The VSP on the HIF-1 board applies slow-process control and line conversion to the 10-bit HD Y data and 10-bit HD C data. VSP output data is transferred to the HD VP *4.

The HD VP adjusts video signal gain, sync phase, etc. and then outputs the HD video data to the VFS2 *5 IC503 *6. The VFS2 delays (SYNC PHASE) the main-line video data.

The VSP output data during HDCAM format playback is also transferred to the down-converter IC600 for SD video output via the VP.

The VFS2 output data is sent to the two TX-96 boards *7 where the data is converted to HD SDI parallel data together with the audio data sent from the APR-52 board, and the parallel data is converted to serial data. The serial data is output from the connectors HD-SDI OUT 1, HD-SDI OUT 2, and HD-SDI OUT 3. For the data to be transferred to HD-SDI OUT 3, character data is superimposed on the TX-96 board.

- Digital Betacam, Betacam SX or analog Betacam format playback

The playback video data is sent from VIOLA on the VPR-64 board to the EPR-1 board. The data is converted to MPEG video data by "MIKE"* MPEG encoder IC202, and is then transferred to the output processing circuit through the TX selector in the FPGA IC900.

MIKE converts the input SD video signals to MPEG data during the recording process.

The SDTI-CP output processing is as follows.

The MPEG video data is converted by IC400 on the EPR-1 board to SDTI-format parallel data together with the audio data from the APR-52 board, and the parallel data is converted to serial data by IC600. The serial data is output from the connectors SDTI-CP OUT 1 and SDTI-CP OUT 2.

The Ethernet output processing is as follows.

The MPEG video data and the audio data from the APR-52 board are sent from the EPR-1 board through the IF-886 board to the VN-13 board for network interface processing. Refer to "9. Network Input/Output Processing" described later.

* MIKE: Nickname of MPEG encoder IC202 on EPR-1 board

SDI (SD) Output (HIF-1, SDI-52, VPR-64/91)

The SDI (SD) output signal processing route varies with the playback format as shown below.

- HDCAM format playback ... **HDW**
  The HD video data is down-converted to SD video data by IC600 on the HIF-1 board. The converted 10-bit SD Y data and 10-bit SD C data are sent to VIOLA on the VPR board.
- Digital Betacam, MPEG IMX or Betacam SX format playback ... **HDW-D/M/S, DVW, MSW**
  The non-compressed 10-bit SD video data decoded on the DPR board is sent to VIOLA on the VPR board.
- Analog Betacam format playback ... **HDW-M/S, DVW-M, MSW-A/M**
  The 10-bit SD video data is sent from the TBC block on the DM-123 board to VIOLA on the VPR board.

- Y ADD and ESR
- Playback VITC signal reading

The 10-bit SD video data from VIOLA is sent to the SDI-52 board together with the CH1/2 to CH7/8 audio data sent from the APR-52 board. On the SDI-52 board, the video/audio data is converted to 10-bit parallel SDI data, and the parallel data is converted to serial data. The serial SD SDI data is output from the connectors SDI OUT 1, SDI OUT 2, and SDI OUT 3. For the data to be transferred to SDI OUT 3, character data is superimposed.

Analog Component and Composite Video Outputs (VPR-64/91)

The 10-bit component video data is transferred from VIOLA to "NICE" *1 digital encoder IC902. NICE converts the component video data to D1 data *2 and D2 data *3.

The D1 data is converted to analog Y/R-Y/B-Y signals by IC920, and these signals are output from the connector ANALOG COMPONENT Y/R-Y/B-Y OUT.

The D2 data is converted to analog composite signal in NICE, and the analog composite signal is output from the connectors ANALOG COMPOSITE VIDEO OUT 1, ANALOG COMPOSITE VIDEO OUT 2, and ANALOG COMPOSITE VIDEO OUT 3. For the data to be transferred to ANALOG COMPOSITE VIDEO OUT 3, character data is superimposed.

9. Network Input/Output Processing

Network Input/Output Processing ... MSW (BKMW-E2000)

(IF-885, IF-886, VN-13)

Network input/output processing is performed on the VN-13, IF-885, and IF-886 boards (mainly by the VN-13 board). The IF-885 board is for mounting the Ethernet connector. The IF-886 board functions as a video/audio data buffer.

Note

ICs in the parentheses below show reference numbers for the VN-13 board with suffix 11.

Video/Audio Signal Processing

The video/audio signal processing block performs packing/unpacking the MXF* file format and synchronizing/desynchronizing for transmit/receive data.

* MXF: Material Exchange Format

• Transmission

When transmitting data, the playback MPEG video data and the playback audio data are sent from the EPR-1 board through the IF-886 board to the VN-13 board. The video/audio data is sent through the video/audio processor IC412 (IC412 and IC501) to IC601 (IC603). IC601 (IC603) writes the video/audio data in the buffer memory IC608 to 611 (IC1007 and IC1008), and then packs the data in accordance with the MXF file format.

• Reception

When receiving data, the MXF file is unpacked and data is read out. The data read timing is controlled by the CPU. The read data is, in the reverse process of transmission, sent from IC601 (IC603) through the video/audio processor to the digital signal processing block for recording on the EPR-1 board.

• File Monitor

When monitoring files (e-monitoring), the baseband video data from the VPR board and the audio data from the APR-52 board are input into the video/audio processor IC412. The baseband video data is processed for raster conversion by the video/audio processor and the SRAM IC413, is further converted to JPEG data by IC415, and is then input into IC601 (IC603). IC603 (IC416) converts the sampling rate of the audio data from 48 kHz to 8 kHz. IC601 (IC603) packs the processed video/audio data for file monitoring.

TCP/IP Processing

The TCP/IP processing block performs TCP/IP packet processing for transmit/receive data.
When transmitting data, the buffer memory data is assembled into packets by the CPU control and the IC601 (IC603) internal processing. Packet data passes through the MAC in IC601 (IC603), receives Physical Layer processing in IC701 (IC1101), and is then output from the Ethernet connector.
When receiving data, receive data is, in the reverse process of transmission, extracted from TCP/IP packets, and is then written in the buffer memory.

CPU

The CPU IC1 controls communication with the system control CPU and video/audio data processing, as well as controls the TCP/IP processing.
The CPU is connected to IC601 (IC603) through the PCI bridge IC2 with the dedicated data bus.

Network Input/Output Processing ... MSW (BKMW-E3000)
(IF-885, IF-886, VN-13, DSP-109)

Network input/output processing is performed on the VN-13, DSP-109, IF-885, and IF-886 boards (mainly by the VN-13 board). The DSP-109 board is used for Proxy. The IF-885 board is for mounting the Ethernet connector. The IF-886 board functions as a video/audio data buffer.

Video/Audio Signal Processing

The video/audio signal processing block performs packing/unpacking the MXF* file format and synchronizing/desynchronizing for transmit/receive data.

* MXF: Material Exchange Format

• Transmission

When transmitting data, the playback MPEG video data and the playback audio data are sent from the EPR-1 board through the IF-886 board to the VN-13 board. The video/audio data is sent through the video/audio processor IC412 to IC601. IC601 writes the video/audio data in the buffer memory IC608 to 611, and then packs the data in accordance with the MXF file format.

• Reception

When receiving data, the MXF file is unpacked and data is read out. The data read timing is controlled by the CPU. The read data is, in the reverse process of transmission, sent from IC601 through the video/audio processor to the digital signal processing block for recording on the EPR-1 board.

• File Monitor

When monitoring files (e-monitoring), the baseband video data from the VPR board and the audio data from the APR-52 board are input into the video/audio processor IC412. The baseband video data is processed for raster conversion by the video/audio processor and the SRAM IC413, is further converted to JPEG data by IC415, and is then input into IC601. IC603 converts the sampling rate of the audio data from 48 kHz to 8 kHz. IC601 acks the processed video/audio data for file monitoring.

Proxy transmission

The baseband video data from the VPR-64 board and the audio data from the APR-52 board pass through the VN-13 board, and are then input into IC1 on the DSP-109 board where filtering is added to the baseband video data. It is then transferred to IC2 for MPEG encoding, and is returned to IC1. The sampling rate of the audio data is converted from 48 kHz to 8 kHz in IC201 to IC204. Thus these processed video/audio data are clipped by IC1, and are then packed in IC601 on the VN-13 board.

TCP/IP Processing

The TCP/IP processing block performs TCP/IP packet processing for transmit/receive data.
When transmitting data, the buffer memory data is assembled into packets by the CPU control and the IC601 internal processing. Packet data passes through the MAC in IC601, receives Physical Layer processing in IC701, and is then output from the Ethernet connector.
When receiving data, receive data is, in the reverse process of transmission, extracted from TCP/IP packets, and is then written in the buffer memory.

CPU

The CPU IC1 controls communication with the system control CPU and video/audio data processing, as well as controls the TCP/IP processing.
The CPU is connected to IC601 through the PCI bridge IC2 with the dedicated data bus.

10. Synchronization

HDW Series (HIF-1, VPR-64)

When recording, the F, V, and H signals, and the 74 MHz clock extracted from the input HD-SDI or SDTI (HDCAM) video data selected for recording are input into the TG* IC702 on the HIF-1 board where F, V, and H signals and several clocks synchronized with the input video are generated.
When playing back, the signal separated from the HD SYNC signal on the connector REF IN is input into the TG on the HIF-1 board where F, V, and H signals and several clocks synchronized with the signal are generated. When no signal is input into REF IN, the 74 MHz clock generated by the TG on the HIF-1 board is used as reference signal.
The TG also sends a sync signal to the TG IC1226 on the VPR board for SD video signal processing.
The TG on the VPR board generates the clocks described in "DVW/MSW Series" below.

* TG: Timing Generator

The reference signal SV REF for servo is generated from the timing signal generated from the input video signal, or from the internal reference signal timing. The SV REF signal is generated or selected by VIOLA and the FPGA0 on the VPR-64 board according to the VTR operating status. The internal reference signal is generated by the 27 MHz crystal oscillator on the VPR-64 board. The SV REF signal is sent to the servo CPU on the SS-89 board.

DVW/MSW Series (HIF-1, VPR-64/91)

Several reference clocks are generated by the circuit block on the VPR board including the TG IC1226 as a core device.
When recording, the following three clocks are generated based on the video signal selected for recording.
When playing back, the analog composite signal on the connector REF VIDEO IN is used as a reference signal.
When no signal is input into REF VIDEO IN, the 27 MHz clock from the crystal oscillator on the VPR board is used as reference clock.

1. 4fsc clock for composite signal (for NTSC and PAL independently)
2. 27 MHz reference clock for video signal processing
3. 24.58 MHz reference clock for audio signal processing

When the HD Upconverter board BKMW-104 is installed, the signal separated from the HD SYNC signal that is input into REF VIDEO IN is sent to the TG on the HIF-1 board where the signal is processed in the same way as the HDW series.
The reference signal for servo is generated in the same way as the HDW series.
